Container power generation parameter settings

Overview

How is shaft generator power determined for container ships?

Based on the collected technical and operational data for container ships of various load capacity, constructed between 2000 and 2015, and by applying different analytical and statistical methods the parameters have been determined. Shaft generators' power has been established in relation to the power of main engines.

Why are generators more commissioned during maneuvering than at berth and sea conditions?

It can be said that the number of generators commissioned during maneuvering is higher than at berth and sea conditions due to the higher power requirements for all vessel types. In addition, it is seen that fewer generators are commissioned when the generators are operated at high capacity.

Are containerized generators reliable?

Years of use in the rental, oil and gas, mining and other heavy-duty industries have tested the reliability, usability and durability of our containerized generators. Our primary design challenges in developing this line of containerized generators were usability, reliability and functionality for the end user.

What size generator container do I Need?

Our generator containers for Type 2, 3, and 4 gas engines have a standard 40-foot length. Width and height depend on engine type, the application (power generation only or CHP) and ambient conditions. Customized sizes to accommodate special project requirements are available on request.

Do ships need a generator based power system?

In general, ships' operations require power lower than the installed generator

capacity. However, when the generator is operated at a low load, its efficiency decreases. In this study, based on actual operation data, the load requirements for each operation mode were analyzed, and a diesel-generator-based power system was designed.

How does a generator strategy reduce fuel consumption compared to onboard generator capacity?

In conclusion, the proposed strategy demonstrated the effect of reducing fuel consumption by 2.2%, increasing generator efficiency by 8.4%, and reducing costs by 5.14% compared to the existing onboard generator capacity for the same vessel. 1. Introduction
