## **N-type photovoltaic panel price**

## Overview

---

N-type solar panels typically command a premium of 10-30% over standard P-type panels from the same manufacturer. According to RegenPower, current pricing for N-type panels ranges from \$0.40 to \$0.60 per watt, compared to \$0.30 to \$0.50 per watt for conventional panels. Are n-type solar panels better than P-type?

N-type solar panels currently have achieved an efficiency of 25.7% and have the potential to keep on increasing, while P-type solar panels have only achieved an efficiency of 23.6%. Manufacturing costs represent one of the few disadvantages of N-type solar panels.

What is a n-type solar panel?

The emitter layer for the cell is negatively doped (N-type), featuring a doping density of  $10^{19} \text{ cm}^{-3}$  and a thickness of  $0.5 \mu\text{m}$ . N-type solar panels are an alternative with rising popularity due to their several advantages over the P-type solar panel.

Do n-type solar panels recombine?

N-type solar panels are immune to this phenomenon and only suffer from regular degradation over the years. Since holes are minority carriers in bulk regions for N-type solar panels, there is less of a window for the recombination process to occur, causing modules to feature higher efficiencies.

Why are PV module prices rising?

As we can see, in major tenders by PV utilities such as China Huadian Corporation and China Resources, manufacturers significantly raised their offers, further reinforcing the upward momentum in module prices.
