

**SolarMax Pro Energy Storage Systems**

## **Outdoor power split type**

## Overview

---

What is a split type air conditioner?

A split type air conditioner consists of two separate units: the indoor unit and the outdoor unit. The indoor unit contains the evaporator coil, the fan, and the air filter, while the outdoor unit houses the condenser coil, the compressor, and the expansion valve. These components work together to cool the air and circulate it throughout the room.

What is the difference between indoor and outdoor split AC?

The indoor unit of the split AC is installed inside the room that is to be air conditioned or cooled while the outdoor unit is installed outside the room in open space where the unit can be installed and maintained easily. Apart from these two major parts there is copper tubing connecting the indoor and the outdoor units.

What is the outdoor unit of a split AC system?

The outdoor unit of a split AC system consists of several components, including a compressor, a condenser, and an expansion valve. The compressor is responsible for compressing the refrigerant, which increases its temperature and pressure. The condenser is responsible for removing heat from the refrigerant and transferring it to the outdoor air.

How does a mini split outdoor unit work?

Electrical wiring and a drain tube are often bundled with them. An electrical service line must be run from the main breaker panel in the building to the mini split outdoor unit. This provides all the power needed to run both components of the system.

What type of condenser does a split air conditioner use?

The condenser used in the outdoor unit of split air conditioners is the coiled copper tubing with one or more rows depending on the size of the air

conditioning unit and the compressor. Greater the tonnage of the air conditioner and the compressor more are the coil turns and rows.

What is a multisplit wiring connection?

Multisplit wiring connection: This type of wiring connection is used in systems where multiple indoor units are connected to a single outdoor unit. Each indoor unit has its own set of wiring connections, and these connections are then connected to the outdoor unit.
