The cost of electricity from energy storage power stations

Overview

What is the cheapest energy storage system?

In terms of TCC (total capital cost), underground CAES (with 890 €/kW) offers the most economical alternative for bulk energy storage, while SMES and SCES are the cheapest options in power quality applications. However, the cost data for these electro-magnetic EES systems are rather limited and for small-scale applications.

Are mechanical energy storage systems cost-efficient?

The results indicated that mechanical energy storage systems, namely PHS and CAES, are still the most cost-efficient options for bulk energy storage. PHS and CAES approximately add 54 and 71 €/MWh respectively, to the cost of charging power. The project's environmental permitting costs and contingency may increase the costs, however.

Are battery electricity storage systems a good investment?

This study shows that battery electricity storage systems offer enormous deployment and cost-reduction potential. By 2030, total installed costs could fall between 50% and 60% (and battery cell costs by even more), driven by optimisation of manufacturing facilities, combined with better combinations and reduced use of materials.

What are energy storage technologies?

Informing the viable application of electricity storage technologies, including batteries and pumped hydro storage, with the latest data and analysis on costs and performance. Energy storage technologies, store energy either as electricity or heat/cold, so it can be used at a later time.

What are energy related costs?

Energy related costs include all the costs undertaken to build energy storage banks or reservoirs, expressed per unit of stored or delivered energy (€/kWh).

In this manner, cost of PCS and storage device are decoupled to estimate the contribution of each part more explicitly in TCC calculations.

Which energy storage system has the lowest capital costs?

The results indicate that underground CAES offers the lowest capital costs (893 €/kW) for bulk energy storage systems, followed by Ni-Cd and Fe-Cr batteries, 1092 and 1130 €/kW, respectively. For power quality applications, SCES and SMES show the lower costs, 229 and 218 €/kW, respectively.
